No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

GENERAL INFORMATION:
APPLICANT: CHEMOKINE THERAPEUTICS CORP.
TITLE OF INVENTION: DESIGN OF CHEMOKINE ANALOGS FOR THE TREATMENT OF HUMAN DISEASES
FILE REFERENCE: $9296.00003
CURRENT APPLICATION NUMBER: PCT/US03/28745
CURRENT FILING DATE: 2003-09-11
NUMBER OF SEQ ID NOS: 1640
SOFTWARE: Patentin version 3.2
                                                                           RESULT 14
US-10-398-457-31
Sequence 31, Application US/10398457
Sequence 31, Application US/10398457
GENERAL INPORMATION:
TITLE OF INVENTION: CHEMOKINES MUTANTS IN THE TREATMENT OF MULTIPLE SCLEROSIS
TITLE OF INVENTION: CHEMOKINES MUTANTS IN THE TREATMENT OF MULTIPLE SCLEROSIS

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The protein was produced by cloning into the expression vector PYMIPSION. The human MIP-laipha sequence was derived from the lambda gt10 cDNA clone hMIP-lai, and the GAPDH promoter sequence, alpha factor transcription terminator derived from plasmid pdAll, the construction of which is described in patent application.

EP0324-274. Recombinantly produced MIP proteins have diagnostic and therapeutic utility for detecting and treating infections, cancer, welopoited evistuation and autoimmune diseases. Although not directly cytotoxic for WEH tumor calls, MPP-1 treated macrophages exhibited enhanced antibody-independent macrophage cytotoxicity for tumour targets. MPP-1 treatment stimulated proliferation of mature tissue macrophages; this effect was synergistic with both CSF-1 and CM-CSF. Purified preparations of the recombinantly derived CM-CSF. Purified preparations of the recombinantly derived MIP-lbeta did not. As little as twofold excess MIP-1beta blocked TNP-inducton by MIP-lalha a significant degree. Other

Most are prepared by reverse transcription of mRNA from activated human leukocytes, then cloning of the cDNA into pVL1392 baculovirus vector, and expression in Sf9 cells in the presence of reduced glutathione and dithiothreitol.

This sequence represents a human chemokine MIP-lbeta domain, derived from HUMACT2A. This sequence is used in the production of a construct comprising an isolated polymuclectide encoding a chimeric polypeptide comprises at least 1 chemokine polypeptide covalently attached to at least 1 heterologous polypeptide. By including a heterologous protein construction, the chimeric polypeptides will have longer and increased biological activity and can direct the chemokine to a particular site. The chimeric polypeptides can also be designed to inhibit or desensitise chemokine receptors. They can be used to affect the chemotactic recruitment of migratory cells, e.g. for stimulating or inhibiting angiogenesis, for regeneration of bone, cartilage, ligament or for treating or preventing inflammatory or autoimmune disorders. They can contract and for preventing inflammatory or autoimmune disorders. They can be used as vaccine adjuvants or to enhance the activity of antigen or presenting cells and for treating or treventing HIV infection.

Set and the repentics for both conditions associated with the chemokine corresponding to the chimeric polypeptide and continue the absorbance of also the chemokine domain of the chimeric polypeptide and continue the chemokine corresponding to the chimeric polypeptide and continue the chemokine corresponding to the chimeric polypeptide and continue the chemokine corresponding to the chimeric polypeptide and corresponding to the chimeric polypeptide and corresponding to the chemokine corresponding to the chemokine domain of the chimeric polypeptide and corresponding to the chemokine corresponding t
Chemokine; MIP-lbeta; chimeric; human; heterologous protein; inhibitor; receptor; chemotaxis; migratory cell; angiogenesis; bone; regeneration; cartilage; ligament; tendon; bone marrow; transplant; inflammation; autofumune disorder; vaccine adjuvant; antigen presenting cell; cancer; HIV; human immunodeficiency virus; therapy; prevention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New chimeric polypeptide(s) - comprise chemokine polypeptide covalently linked to heterologous polypeptide, used for, e.g. chemotactic recruitment of migratory cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human chemokine MIP-1beta domain protein fragment.
                                                                                                                                                                                                                                                                                                                             61 PAVVFQTKRSKQVCADPSESWVQEYVYDLELN 92

This sequence represents a human beta chemokine, Act-2 which is used to describe a method in which a novel beta chemokine, ZCHEMO-8 is isolated. Cascribe a method in which a novel beta chemokine, ZCHEMO-8 is isolated. Altered levels of ZCHEMO-8 indicative of pathological conditions, including infections, cancer, whelpopietic disorders, autoimmune closed and immunodeficiencies. The ZCHEMO-8 polypeptides can be used, sound healing regime to stimulate an infiltration of immune cells (e.g. wound healing regime to stimulate an infiltration of immune cells (e.g. monocytes, neutrophils, T lymphocytes or basophils to a wound site to the marrow into the peripheral blood for transplants. ZCHEMO-8 call trom the mediating suppression of HIV replication in CD4 T-cells and limiting progression of HIV infection to AIDS. Use may be made of ZCHEMO-8 polypeptides could be used to further define the role of chemokines in mediating suppression of HIV replication in CD4 T-cells and limiting progression of HIV infection to AIDS. Use may be made of ZCHEMO-8 progression of HIV infection to AIDS. Use may be made of ZCHEMO-8 certain macrophages, neutrophils, basophils, B lymphocytes and/or T cells may be effective. Such diseases where the inhibition of activation of certain macrophages, neutrophils, basophils, B lymphocytes and/or T cells may be effective. Such diseases include autoimmune diseases e.g. multiple sclerosis, insulin-dependent diabetes and systemic lupus erythematory and infective diseases. Antagonists may be used to dampen or inactivate and infective diseases. Antagonists may be used to dampen or inactivate zenemo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     autoimmune diseases, atherosolerosis, osteoporosis, HIV infection and AIDS, psoriasis, inflammatory diseases, hypertension, basophil-mediated diseases, endoctoxaemia, myocardial infarction, acute ischaemia and rheumatoid arthritis, and can be used to prevent strokes and as contraceptives. The coding sequences for the chemokines can be used in gene therapy for the same diseases, as well as in the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide 3, amide and heterocyclic compounds and saccharide conjugates used for inhibiting chemokine induced activity and for treating e.g. stroke, vascular diseases, autoimmune diseases and tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention concerns the identification of a number of chemokines which can be used to produce derivatives, agonists and antagonists which are then useful in disease treatment. The chemokines include sequences AAB15785-B15794, AAB15803-B15813 and AAB15813-B15813 These chemokine derivatives can be used to treat diseases such as
                                                                                                         Gaps
                                                                                                         .

The present invention relates to selenoproteins encoded in the genome of a virus, where the coding sequence of the selenoprotein is genetically engineered for expression in a nuclaic acid construct. The invention also discloses a method for identifying selenoprotein coding sequences, for detecting certain viruses (e.g. HIV or Boola), cancer and immune system disorders. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New selenoprotein for use in detecting certain viruses, e.g. human immunodeficiency virus (HIV) or Ebola, cancer and immune system

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to selenoproteins encoded in the genome of a virus, where the coding sequence of the selenoprotein is genetically engineered for expression in a nucleic acid construct. The invention also discloses a method for identifying selenoprotein coding sequences, for detecting certain viruses (e.g. HIV or Ebola), cancer and immune system disorders. The present sequence was used to illustrate the invention.

                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a human chemokine MIP-lbeta domain, isolated from cDNA clone MPB-X. This sequence is used in the production of a construct comprising an isolated polymuclectide encoding a chimeric comprises at least 1 chemokine polypeptide covalently attached to at least 1 heterologous polypeptide. By including a netached to at least 1 heterologous polypeptide. By including a heve construction, the chimeric polypeptides will have longer and increased biological activity and can direct the chemokine to a particular site. The chimeric polypeptides can also be chemokine to a particular site. The chimeric polypeptides can also be considered the chemotractic recruiting transplanted bone marrow constituting or inhibiting angiogenesis, for regeneration of bone, to affect the chemotractic recruitment of migratory cells, e.g. for stimulating or inhibiting angiogenesis, for regeneration of bone, confident to the chemotractic recruiting or prevention inflammatory or autoimmune disorders. They can also be used as vaccine adjuvants or to autoimmune disorders. They can also be used as vaccine adjuvants or to preventing HIV inflection. Neutralising antibodies binding to the chimeric polypeptide and also in the treatment of some forms of the chimeric polypeptide and also in the chemokine is involved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 MKLCVTVLSLLMLVAAFCSPALSAPMGSDPPTACCFSYTARKLPRNFVVDYYETSSLCSQ 60

The present invention relates to methods for identifying genes and proteins that are implicated in a specific disease or physiological condition. The method comprises comparing the transcriptome/protecome of a specialised cell type implicated in a disease or condition with that of a second specialised cell type inder two experimental conditions, and identifying agene that is differentially regulated in the two specialised cell types under experimental conditions. ABV7813. ABV78116 and ABP65061-ABP65257 were identified using the methods of the invention. The coding sequences and proteins are useful for treating a disease in a patient, for manufacture of a medicament for treating hypoxia regulated conditions, and for regulating tumourigenesis, anglogenesis, apoptosis, biological response to hypoxia conditions, or hypoxic-associated condition, such as cancer, ischaemic conditions, reperfusion injury, retinopathy, neonatral stress, preeclapmist, atherosclerosis, inflammatory conditions, wound healing, inflammation, erythropolesis or hair loss.
Cytostatic; vasotropic; tranquiliser; antiatherosclerotic; gene therapy; antiinflammatory; vulnerary; gynecological; ophthalmological; vaccine; hypoxia; tumourigeneeis; anglogenesis; apoptosis; cancer; ischaemic condition; reperfusion injury; retinopathy; neonatal stress; preeclapmsia; atherosclerosis; inflammatory condition; wound healing; inflammation; erythropoiesis; hair loss; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 MKLCVTVLSLLMLVAAFCSPALSAPMGSDPFTACCFSYTARKLPRNFVVDYYETSSLCSQ 60

                                                                                                                                                                                                                                                                 The present invention relates to selenoproteins encoded in the genome of a virus, where the coding sequence of the selenoprotein is genetically engineered for expression in a nucleic acid construct. The invention also discloses a method for identifying selenoprotein coding sequences, for detecting certain viruses (e.g. HIV or Ebola), cancer and immune system disorders. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                             1 MKLCVTVLSLLMLVAAFCSPALSAPMGSDPPTACCFSYTARKLPRNFVVDXYETSSLCSQ 60

RESULT 13

The present invention relates to the isolation of novel human polypeptides referred to as NOVX (NOVI-NOV44), variants of these proteins, and the polynucleotide encoding them. The NOVX proteins of the invention are G-protein coupled receptor (GPCR) related proteins. The sequences of the invention are useful in the manufacture of a medicament for treating a syndrome related to a human disease associated with the polypeptides e.g. cancer. ABU52111-ABU52408 represent the human NOVX proteins of the invention.

The MIP-1, MIP-2 or analogue may be operatively linked to a carrier. The MIPs can be used to inhibit megakaryocytopoiesis to effect in vivo reduction of platelet nos. They can be used to treat disorders with excessively high platelet counts such as thrombocytosis, stroke, pulmonary emboliand myeloproliferative disorders.

The invention relates to an isolated polynuclectide (I) comprising one of 245 sequences (ABQ93288-ABQ93532). Treating a condition comprising administering to a manahalian subject a composition comprising the protein (II) encoded by (I) (ABP62809-ABP63053) or an antibody (III) to (II).

(I), (II) and (III) are useful for diagnostic evaluation of disorders.

(I) is useful for gene therapy of diseases and (II) can be used for therapeutic treatment. Diseases that may be treated include wound healing and tissue repair, burns, central nervous system disorders (e.g. Alzheimer's, Parkinson's, Huntington's and amylotrophic lateral sclerosis, immune deficiencies, cancer, autoimmune disorders, multiple sclerosis, diabetes and allergies.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MKLCVTVLSLLMLVAAFCSPALSAPMGSDPPTACCFSYTARKLPRNFVVDYYETSSLCSQ 60
